

Overview

This release of The Hub[®] software features temperature rise variable support, template archiving, job data search by custom field, and cycle graph menu improvements; the release also includes temperature rise bug fixes.

New Features

In-mold temperature sensor users can now add and view temperature rise variables.

Users can now view and archive templates on the cycle graph and on process sheets.

Users can now search job data on The Hub using any entered custom fields.

The Hub software's cycle graph menu now matches the CoPilot software's cycle graph menu.

Fixed Issues

When a user added temperature rise variables to a process on the connected Copilot system, the process became unavailable to view on the connected The Hub system.

When a user viewed Reports: Trends, there was no summary data available for temperature rise variables.
